

Dataverse Network (DVN) Patent Network Database Project

Harvard Business School
Institute for Quantitative Social Science, Harvard University

University of Trento – Thursday, July 16, 2009

Ronald Lai rolai@hbs.edu
Alex D'Amour adamour@iq.harvard.edu
Lee Fleming lfleming@hbs.edu

Access Our Dataverse at: <http://dvn.iq.harvard.edu/dvn/dv/patent>

We would like to thank the NSF for supporting this research. Errors and omissions remain ours (though we ask that you bring them to our attention).

DVN Patent Network Database Project

 **INTRO DATAVERSE NETWORK**

Institutional Support

3

Roadmap

• PRELUDE PATENT DATA

- Patent data. (Flat data, network data)
- Inventor disambiguation.
- ★ *Brief* overview, hold questions until lab time.

• FROM RESEARCH INTEREST TO REGRESSIONS

- Patents – Why? How? Now what?
- ★ Lab time to test drive DVN network tools.

4

PRELUDE PATENT DATA

Patent Data, A glimpse

<i>Invnum_N</i>	<i>Name</i>	<i>Patent</i>	<i>Assignee</i>	<i>City</i>	<i>Loc</i>	<i>...</i>
12345	Fleming, Lee	5029133	HP	Fremont	CA	...
12345	Fleming, Lee	9999999	Harvard	Cambridge	MA	...
45678	D'Amour, Alex	9999999	Harvard	Boston	MA	...
67890	Lai, Ronald	9999999	Harvard	Randolph	MA	...

- Prof Fleming, Alex, and Ron collaborate on patent 9999999.
 - ★ Data are organized in unique inventor-patent pairs.
 - *Unique inventor number* (HBS disambiguation algorithm), constant between patents.
 - Patent is assigned to one entity (usually inventors' employer or self if blank), constant over a patent.
 - City and Loc are personal addresses (at the city level) of inventors, vary over a patent.

Patent Data, Our process

7

Patent Data, Disambiguation

- **Current method (2008)**
 - Linear, unsupervised.
 - Records are compared element by element.
 - Similarity between records is a weighted average of element-wise similarity scores.
 - Currently, weights are not optimized.
- **Future methods (est. 2010)**
 - Semi-supervised with automatically generated training sets.
 - Multi-dimensional similarity profiles.
 - Optimal weighting, non linear interactions.
 - ★ Looking for collaborators for this initiative.

8

Patent Data, Known issues

- US inventors are better disambiguated
 - Location information is more specific for US.
 - Large name, assignee variation.
 - Thus, Asian inventors are especially difficult.
- Time inconsistency
 - Assignee information changes as a function of mergers, renaming.
 - Zip codes change over time.
- Name inconsistencies
 - Typographical errors.
 - Nicknames and name changes.

9

Patent Data, Data sources

- HBS patent dataset (incl. documentation for inventor disambiguation algorithm):
 - <http://dvn.iq.harvard.edu/dvn/dv/patent/>
- NBER patent data
 - <http://www.nber.org/patents/>
- USPTO patent data (FTP based):
 - <ftp://ftp.uspto.gov/pub/patdata/2009/Grants/>
- HBS algorithms will be publically available as we encourage **open community** improvement!

10

Patent Data, Contents

Inventor-
Patent
Database

**HBS algorithm generated variables.*

INVENTOR

<i>Invnum_N</i>	<i>Unique inventor number.</i>
Name	Inventor name (Last, first middle initial)
Inv_Seq	Inventor number on patent.

PATENT

<i>Invpatseq</i>	<i>Generated patent history sequence for inventor.</i>
Pat_Type	94% Utility (U), 5% Design (D).
Patent	USPTO assigned patent number.
AppDate	Patent application date.
GDate	Patent grant date.
Claims	Total patent claims.

INVENTOR LOCATION

City	Inventor's city.
Loc	(US only) State or Country code.
Zipcode	(US only) Zipcode.
Usflg	US = 1 (50 states, D.C. and territories)

ASSIGNEE

Assignee	Primary firm associated with patent.
Numasg	Generated assignee number.

CLASSES

Classes	Classes separated by " ". Main-Sub. Primary class listed first. 7 maximum.
<i>Scls_cnt</i>	<i>Count of total classes.</i>
<i>Scls_1</i>	<i>Flag. Contains a first occurrence of class.</i>
<i>Scls_pair_1</i>	<i>Total of first occurrence of class-pairs.</i>

CITATION (Fieldnames combine the concepts)

<i>Back</i>	<i>Backward citations (patents cited to)</i>
<i>Forw</i>	<i>Forward citation (patents cited from).</i>
<i>5</i>	<i>5 year window, (otherwise, for all time).</i>
<i>SC</i>	<i>Assignee self citation.</i>

11

Creating the Network

Invnum_N	Name	Patent	Assignee	City	Loc	...
12345	Fleming, Lee	5029133	HP	Fremont	CA	...
12345	Fleming, Lee	9999999	Harvard	Cambridge	MA	...
45678	D'Amour, Alex	9999999	Harvard	Boston	MA	...
67890	Lai, Ronald	9999999	Harvard	Randolph	MA	...

Group by *Unique Inventor Identifier.*

Merge with self on patent number.

VERTICES (INVENTORS)

Invnum_N	Name
12345	Fleming, Lee
45678	D'Amour, Alexander
67890	Lai, Ronald

EDGES (PATENT)

Head	Tail	Patent	...
12345	45678	9999999	...
12345	67890	9999999	...
45678	67890	9999999	...

Note: Some information is lost in constructing the network dataset. Only certain variables from the inventor-patent data are recorded in the network. Also, patents of singleton inventors are not recorded. It is necessary to complement the network dataset with the inventor-patent dataset for a full picture.

12

Network Data

Vertex-Edge
Dataset

VERTICES (INVENTORS)	
<i>Invnum_N</i>	<i>Inventor number on patent.</i>
Name	Inventor name (Last, first middle initial)

EDGES (PATENT)	
<i>H</i>	<i>"Head" inventor – inventor on the edge with the smaller id number. Loc, City, Zip for each inventor is also provided.</i>
<i>T</i>	<i>"Tail" inventor – inventor on the edge with larger id number. Loc, City, Zip for each inventor is also provided.</i>
<i>Numasg</i>	<i>Generated assignee identifier.</i>
Pat_Type	94% Utility (U), 5% Design (D).
Patent	USPTO assigned patent number.
AppYear	Patent's application year.

Note: Due to space and memory constraints, a number of these edge or vertex attributes may be left out from larger networks posted on our Dataverse.

DVN Patent Network Database Project

FROM RESEARCH INTEREST TO REGRESSIONS

DVN Patent Network Database Project

• **STEPI** RESEARCH INTEREST

Research Interest

- Applicable Research
 - Origin of breakthroughs
 - Impact of legislation on innovation
 - Organizational influence on innovation

Example: How did breakthroughs in RNAi technology take place?

Challenge: Mapping this idea (RNAi) onto a point of entry for the inventor network.

Research Interest

- Patents as a point of entry
- <http://patft.uspto.gov/netahtml/PTO/search-adv.htm>

- + The USPTO website allows users to define a flexible query to pinpoint research interest.
- USPTO patent results are difficult to manipulate (large queries result in several pages of patent detail, with a maximum of 50 per page)

Research Interest

✚ Our team has developed a solution that allows the flexibility of the USPTO query feature while reducing the redundancies of the USPTO patent result page.

★ Let us illustrate our solution through searching for our stated research interest, RNAi.

Research Interest

📁 Grab patcrawl.zip from the Dataverse.

DVN friendly
output (text
file included).

Note: The .exe version of this script only runs on Windows. To run on other platforms:

1. Install Python.
2. Install PyCurl and BeautifulSoup modules.
3. Execute pat_crawl.py.

DVN Patent Network Database Project

STEP2 NETWORK PLATFORM

Network Roadmap

• With RNAi patents defined as the point of entry, let's explore the network around the time of discovery (1998).

★ This is a hands-on example of a workflow that you might follow.

Patent Query for Inventors

RNAi PRESENTATION
DATA FILE: RNAI3_NEW.XML

[Back to Study](#)

Write a Manual Query to subset this network data by filtering on vertex or edge attributes.

Manual Query

Attribute Set: **Edge**

Query Workspace:

```
patent %in% c("7550580", "7550143", "7541344", "7534878", "7527936", "7521224", "7521056", "7517864", "7514548", "7504492", "7498316", "7485414", "7482130", "7479584", "7479369", "7459547", "7429656", "7422853", "7419779", "7413870", "7368559", "7368248", "7282564", "7232808", "7176304", "7150970", "7129223", "7109173", "7101991", "7094945", "7090990", "7087433", "7078196", "7056704", "7022828", "6806066")
```

Eliminate disconnected vertices

Manual Query Builder

Use these attribute and operator selectors to build a query string in the Query Workspace.

And Or

Attributes: name, textname, loc, zipcode, city

Operators: Equal to, ==

Values:

Paste patent query here.

Patent data are stored in edges.

Drop non-RNAi inventors.

23

Patent Query Result

- Run the query and check the Subset History.

Subset History

Label	Attribute Set	Query	Vertices	Edges	
Initial State			7308	96501	<input type="button" value="Restart"/>
Manual Query	edge	patent %in% c("7550580", "7550143", "7541344", "7534878", "7527936", "7521224", "7521056", "7517864", "7514548", "7504492", "7498316", "7485414", "7482130", "7479584", "7479369", "7459547", "7429656", "7422853", "7419779", "7413870", "7368559", "7368248", "7282564", "7232808", "7176304", "7150970", "7129223", "7109173", "7101991", "7094945", "7090990", "7087433", "7078196", "7056704", "7022828", "6806066")	52	96	<input type="button" value="Undo"/>

- Whittled down to 52 inventors.
- Now explore their social networks.

24

Neighborhood Query for Networks

Subset with an Automatic Query to choose parts of the network based on structural properties.

Automatic Query Function: Largest Graph Nth (default value = 1)

Largest Graph
Largest Graph
Biconnected Graph
Neighborhood

Choose Neighborhood Auto Query

How many steps out?

Neighborhood 1

Vertices: 222

Edges: 1861

Neighborhood 2

Vertices: 1210

Edges: 12269

Note: $N(g, 2) \equiv N(N(g, 1), 1)$

AppYear Query to Localize

- Now, drill down to the network surrounding 1998, when Fire, et al. published their Nobel Prize winning study on RNAi in *Nature*.

Manual Query Attribute Set: Edge Query Workspace: `appyear > "1995"`

Eliminate disconnected vertices

Use the Manual Query Builder to check which attributes are available for subsetting.

Manual Query Builder

Use these attribute and operator selectors to build a query string in the Query Workspace.

And Or

Attributes: h_zip appyear t_zip patent pat_type

Operators: Greater than, >

Values: 1995

Network Measures

i Run a Network Measure to generate new network-based attributes for the vertices.

Network Measure

Attributes: Bonacich Centrality (dropdown menu showing Page Rank, Degree, Unique Degree, In Largest Component, Bonacich Centrality)

Parameters (default value):

- alpha (1):
- exo (1):

Run

Some network measures require parameters which appear here.

- Measures are dynamically calculated
- Added as a new vertex attribute

Technical Note: Bonacich Centrality measures are only valid for the largest component of the network. Run “Largest Graph” with Nth=1 to extract the largest component before running Bonacich Centrality. For multiple components, use PageRank. Bonacich centrality will run on multiple components, but its asymptotic behavior is undefined.

Technical Note: Bonacich Centrality is Alpha Centrality, published by Bonacich, et al in 2001. It is parametrized by alpha, the decay parameter, and exo, the exogenous status parameter, which at this point can only be uniform. Alpha can be no larger than the inverse of lambda, the largest eigenvector of the adjacency matrix. The parameter here is a proportion of the inverse of lambda, i.e. alpha = 0.5 corresponds to $\alpha = 0.5 * 1/\lambda$.

Export

Soon, this history will be included in download to make analyses easier to replicate.

Subset History

Label	Attribute Set	Query	Vertices	Edges	
Initial State			7308	96501	Restart
Manual Query	edge	patent %in% c("7550580", "7550143", "7541344", "7534878", "7527936", "7521224", "7521056", "7517864", "7514548", "7504492", "7498316", "7485414", "7482130", "7479584", "7479369", "7459547", "7429656", "7422853", "7419779", "7413870", "7368559", "7368248", "7282564", "7232808", "7176304", "7150970", "7129223", "7109173", "7101991", "7094945", "7090990", "7087433", "7078196", "7056704", "7022828", "6806066")	52	96	
Automatic Query	N/A	Neighborhood (1)	222	1861	
Automatic Query	N/A	Neighborhood (1)	1210	12269	
Manual Query	edge	appyear > "1995"	1022	9399

Click to download resulting graph in GraphML and flat file formats (vertex table and edge list).

Download the last subset. Download Results

Output

29

Visualization

- Pajek 
 - DVN exports to GraphML, so conversion is necessary.
 - 📁 Grab graphml2pajek.zip from our Dataverse.
 - ★ The DVN will soon support direct Pajek downloads.
- Visualization Programs that support GraphML
 - yEd  http://www.yworks.com/en/products_yed_about.html
 - GUESS **GUESS** <http://graphexploration.cond.org/index.html>
 - Gephi  <http://www.gephi.org>
 - Most Java based engines/libraries
- Most graph libraries (igraph, JUNG) parse GraphML.
- Download the R workspace for igraph directly.

30

STEP 3 TABULAR PLATFORM

Tabular Platform

- RNAi_inventor_pats.tab
- Subsetting functionality is limited.
- + Only download columns you need.
- + For additional subsetting, leverage vertex-edge data to constrain variables.
- ★ The DVN team will be working on new features to enhance flexibility for its tabular platform.

Column Download

RNAI PRESENTATION
DATA FILE: RNAI3_INVENTOR_PATS.TAB

Download Subset
 Recode & Case-Subset
 Descriptive Statistics
 Advanced Statistical Analysis

Click the "Download Subset" tab to access this page.

Only check columns you need to reduce memory requirements.

Be sure to show all variables.

Variable Information Table

<input type="checkbox"/>	Type	Name	Label	Summary
<input type="checkbox"/>	Discrete	invpatseq	invpatseq	
<input checked="" type="checkbox"/>	Character	invnum_N	invnum_N	
<input type="checkbox"/>	Character	pat_type	pat_type	
<input checked="" type="checkbox"/>	Character	patent	patent	
<input checked="" type="checkbox"/>	Character	name	name	
<input type="checkbox"/>	Discrete	inv_seq	inv_seq	
<input checked="" type="checkbox"/>	Character	annrdate	annrdate	

Show: **All** (dropdown menu with options: 10 Variables, 20 Variables, 50 Variables, All)

Case Subsetting

Click the "Recode & Case Subset" tab to access this page.

See Help Text for subsetting notation.

Selected Variables

- invnum_N
- patent
- name
- appdate
- USFlg**

Start

Choose a variable below, then click here to subset on it.

Use "Drop" and conditions to shrink the dataset.

How to enter a value or range as a condition: ?

Drop	USFlg	New Value	New Value Label
<input checked="" type="checkbox"/>	0	0	
<input type="checkbox"/>	1	1	
<input type="checkbox"/>	.	.	

Add Value/Range

Apply Recodes

Apply recodes when done, then return to Download page.

Tabular Platform

INVENTOR	
<i>Invnum_N</i>	<i>Unique inventor number.</i>
Name	Inventor name (Last, first middle initial)
Inv_Seq	Inventor number on patent.

PATENT	
<i>Invpatseq</i>	<i>Generated patent history sequence for inventor.</i>
Pat_Type	94% Utility (U), 5% Design (D).
Patent	USPTO assigned patent number.
AppDate	Patent application date.
GDate	Patent grant date.
Claims	Total patent claims.

INVENTOR LOCATION	
City	Inventor's city.
Loc	(US only) State or Country code.
Zipcode	(US only) Zipcode.
Usflg	US = 1 (50 states, D.C. and territories)

Inventor-Patent Database

**HBS algorithm generated variables.*

ASSIGNEE	
Assignee	Primary firm associated with patent.
Numasg	Generated assignee number.

CLASSES	
Classes	Classes separated by " ". Main-Sub. Primary class listed first. 7 maximum.
<i>Scls_cnt</i>	<i>Count of total classes.</i>
<i>Scls_1</i>	<i>Flag. Contains a first occurrence of class.</i>
<i>Scls_pair_1</i>	<i>Total of first occurrence of class-pairs.</i>

CITATION (Fieldnames combine the concepts)	
<i>Back</i>	<i>Backward citations (patents cited to)</i>

<i>5</i>	<i>5 year window.(otherwise, for all time).</i>
<i>SC</i>	<i>Assignee self citation.</i>

35

DVN Patent Network Database Project

STEP4 REGRESSIONS

36

Regressions

- Researchers can easily run regressions using the DVN network or tabular data (flat files).

★ Suppose you wanted to merge the two datasets.

Vertex-Edge Dataset

↑ Can merge on common fields ↓

Tab Delimited Text File

SQL Code

STATA Code

```
select *
from vertices as a
inner join
dvnData as b
on a.invnum_N = b.invnum_N
```

See next slide...

37

Regressions, Stata import

Grab `vertex_dta_merge.do` from our [Dataverse](#).

```
clear
*adjust to your personal directory
cd "C:\[[path to data]]"

*convert vertices to dta format
insheet using "vertices.tab"
generate invnum_N=string(invnum_n, "%15.0g")
drop invnum_n
save "vertices", replace

*sort dvn file
use [[dvnDataFile]], clear
sort invnum_N
save [[dvnDataFile]], replace

*merge [[dvnDataFile]] with records in vertices
use "vertices.dta", clear
sort invnum_N
merge invnum_N using [[dvnDataFile]]

*tidy up and save
drop if _merge != 3
drop _merge
save "[[merged file]]"
```

Change working directory to where vertices.tab and dvnDataFile_#####.dta were extracted.

STATA interprets invnum_N as a numerical value, even though it is stored as string. We need to convert it back to string, retaining all digits, to merge.

Change this to the name of the dta file from the DVN Tabular output.

Change this to what you want to name the final merged dataset.

38

Regressions, Examples

Example:

```
nbreg forw bonacich_c claims back5
```

```
Fitting Poisson model:
Iteration 0: log likelihood = -11763.919
Iteration 1: log likelihood = -11763.71
Iteration 2: log likelihood = -11763.71

Fitting constant-only model:
Iteration 0: log likelihood = -8095.5749 (not concave)
Iteration 1: log likelihood = -5557.1525
Iteration 2: log likelihood = -5437.2324
Iteration 3: log likelihood = -5433.9893
Iteration 4: log likelihood = -5433.9887
Iteration 5: log likelihood = -5433.9887

Fitting full model:
Iteration 0: log likelihood = -5426.2683
Iteration 1: log likelihood = -5424.9179
Iteration 2: log likelihood = -5424.9137
Iteration 3: log likelihood = -5424.9137

Negative binomial regression          Number of obs =      12357
dispersion = mean                    LR chi2(3)          =      18.15
Log likelihood = -5424.9137          Prob > chi2        =      0.0004
                                      Pseudo R2          =      0.0017
